Amendments to and Listing of the Claims:

Please amend claim 1, cancel claim 2, and add new claims 9 and 10 so that the claims read as follows:

- (currently amended) A resin composition for stereolithography, which is an
 actinic radiation-curable resin composition comprising:
- a cationic-polymerizable organic compound;
- a radical-polymerizable organic compound;
- a photo initiator for cationic polymerization; and
- a photo initiator for radical polymerization.

wherein the photo initiator for cationic polymerization comprises a compound represented by the following formula (I), the compound having a purity of [[80%]] 97% or higher and containing less than 3% by mass of a compound represented by the following formula (II):

wherein M represents an antimony atom or a phosphorus atom; and the broken line between S⁺ and MF₆ represents an ionic bond.

Application No. 10/562,098 Reply to Office Action dated June 29, 2007

(Canceled)

- (Previously Presented) The resin composition for stereolithography as claimed in claim 1, wherein M in the compound represented by the formula (1) is an antimony atom.
- (Previously Presented) The resin composition for stereolithography as claimed in claim 1, wherein M in the compound represented by the formula (D is an antimony atom.
- (Previously Presented) The resin composition for stereolithography as claimed in claim 1, wherein the cationic-polymerizable organic compound comprises at least one compound having an epoxy group.
- (Previously Presented) The resin composition for stereolithography as claimed in claim 1, wherein the radical-polymerizable organic compound comprises at least one compound having a (meth)acryl group.
- (Previously Presented) The resin composition for stereolithography as claimed in claim 1, which comprises an oxetane compound at a ratio of from 1 to 30% by mass with respect to the mass of the cationic-polymerizable organic compound.
- (Previously Presented) The resin composition for stereolithography as claimed in claim 1, which comprises a polyalkylene ether compound at a ratio of from 1 to 30% by mass with respect to the mass of the cationic-polymerizable organic compound.
- (New) The resin composition for stereolithography as claimed in claim 1, wherein a concentration of diphenyl sulfoxide in the compound represented by formula (I) is less than 0.05% by mass.
- 10. (New) The resin composition for stereolithography as claimed in claim 1, wherein the photoinitiator for cationic polymerization contains substantially no compound represented by formula (II).
